

Compiling global oil supply-chain data with Agentic AI

Simon Schulte (University of Freiburg) | 23.09.2026 | @Brightcon 2026

Two safety nets for verification

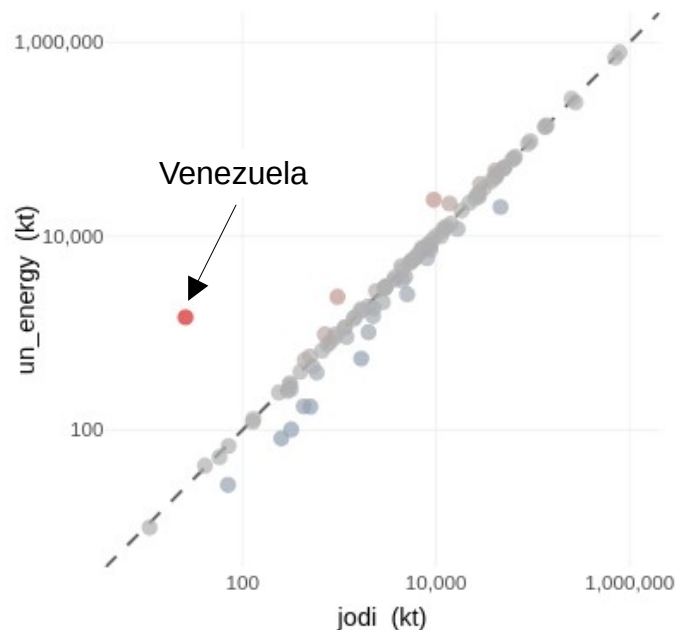

1. Accounting identities

Crude (all grades aggregated): supply + imports vs refinery use + exports

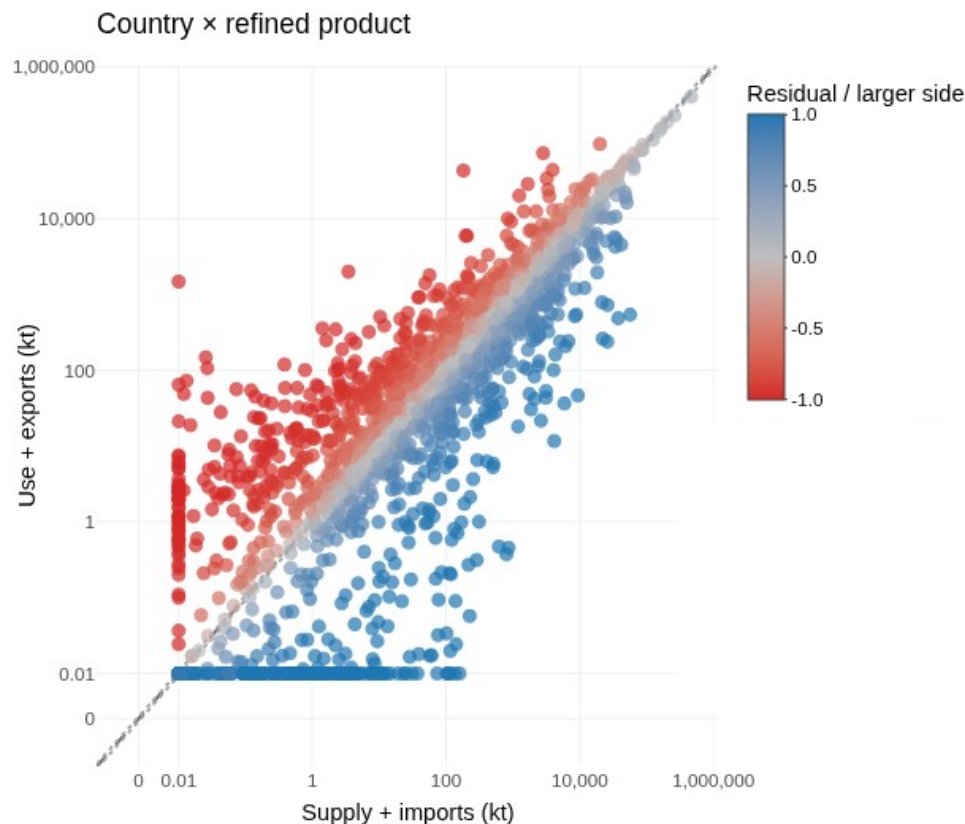

2. Data source redundancy

refining_input: jodi vs un_energy

... but there is still a lot to verify

Takeaways

- with coding agents, the bottleneck shifts from writing code to **verifying it**
- we need **more good open-source community tools** that are thoroughly tested and robust, because every tested building block is one less thing to verify.
